

# Energy Security in Baltic Countries and Finland:

development of electricity systems in Baltic  
States and Finland taking into account  
security and reliability aspects

Arvydas Galinis  
Lithuanian Energy Institute

*(The study was performed by the Lithuanian Energy  
Institute and Aalto university)*

This project has received funding from the European  
Union's Horizon 2020 research and innovation  
programme under grant agreement No 691739.

# Introduction and methodological approach

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Energy security

- Energy security is a **complex and multidimensional** concept that has evolved along the years
- It started with the 1970s oil crises and its concerns on the dependency on fossil fuel import and other interdisciplinary issues, such as **affordability, social acceptance, and environmental impacts**.
- Energy security is defined as **“the ability of the energy system to **uninterruptedly supply** energy to consumers **under acceptable prices** and to **resist potential disruptions** arising due to technical, natural, economic, socio-political and geopolitical threats”**

# Object of the analysis

## Electricity system of Baltic States and Finland and district heating systems (in lower extent)

- *Although positive from a diversification point of view, **significant share of intermittent electricity generation** (in particular wind) **creates additional energy security challenges** as it requires the power system to maintain sufficient **balancing capacities** at all time*
- *Substantial amount of electricity imports from third countries to Baltic countries **together with possible malfunctions of individual elements** of the electricity system is another energy security concern because it requires large **reserve capacities***

# General assumptions and conditions

In order to ensure energy security, measures for it's assurance have to be foreseen already **at the energy development planning stage** and **put into practice in time**.

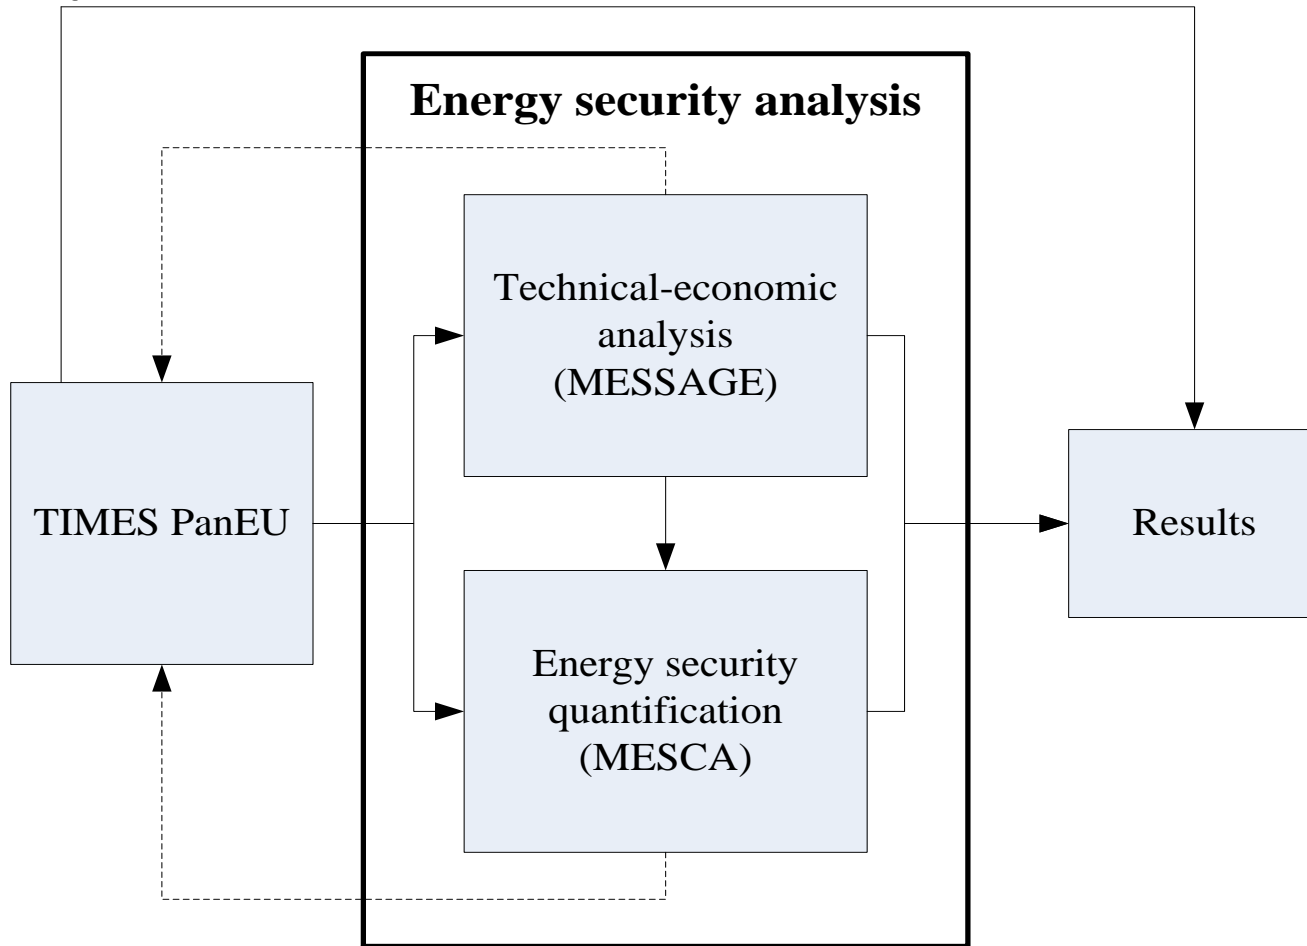

Energy security in Estonia, Finland, Latvia, and Lithuania is considered in the context of the development of the energy sector **operating under market conditions** that determine the cost-effectiveness of different individual energy generation sources as well as the attractiveness of energy security measures.

**Environmental restrictions** associated with climate change mitigation as well as **country specific and EU energy policy requirements** also are taken into account.

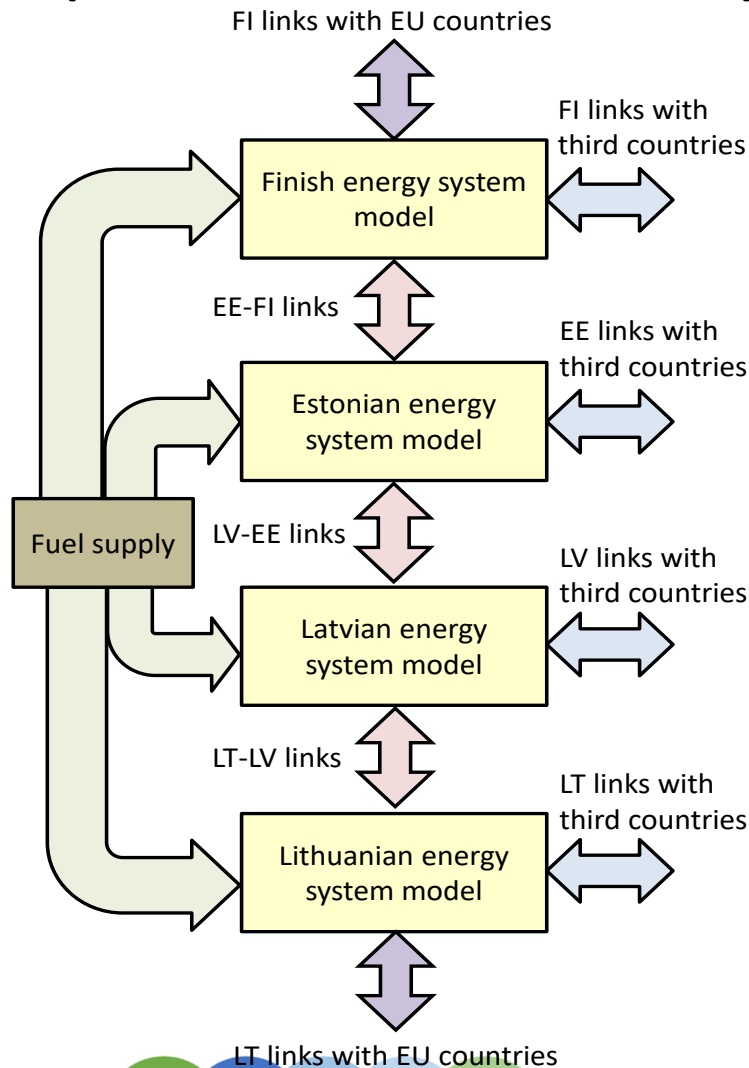

Energy security analysis in the REEEM project was based **on mathematical modelling** of prospective energy sector operation and development

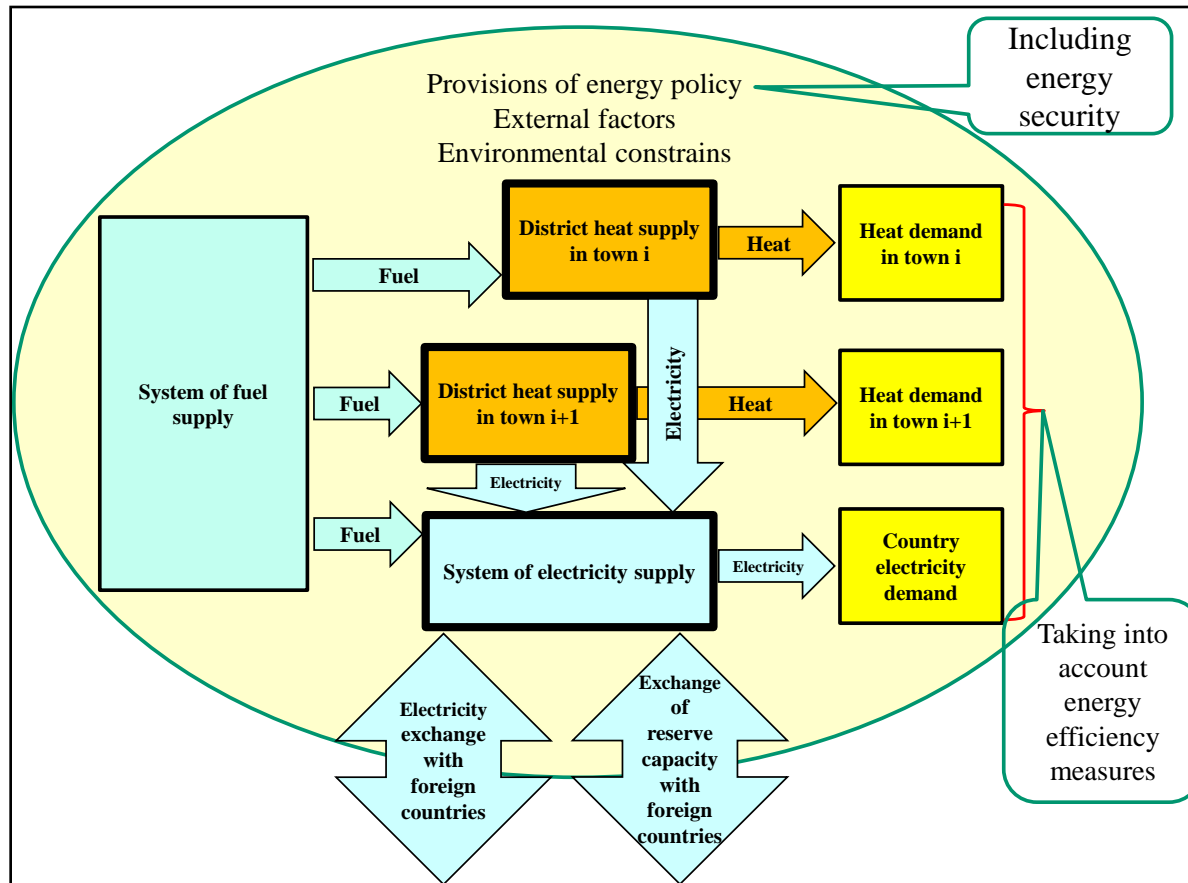

# Mathematical models in analysis of energy security

# Structure of mathematical model for analysis of energy system operation and development

# Structure of country energy system model

# Methodological approach

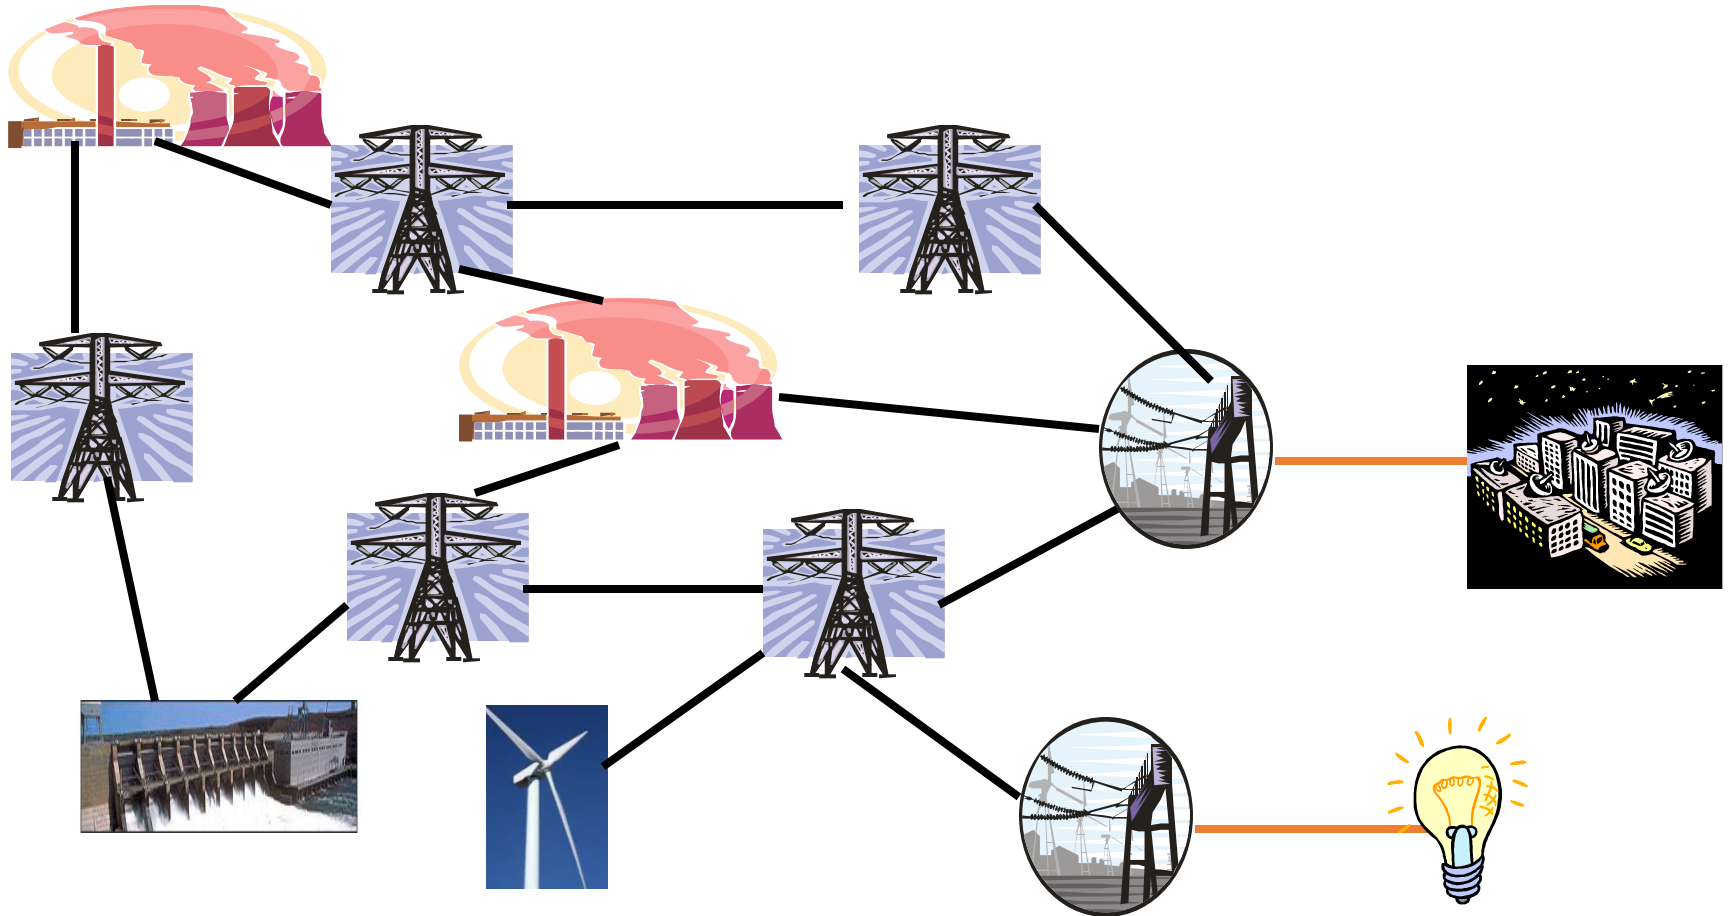

## *Modelling of wind variability*

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

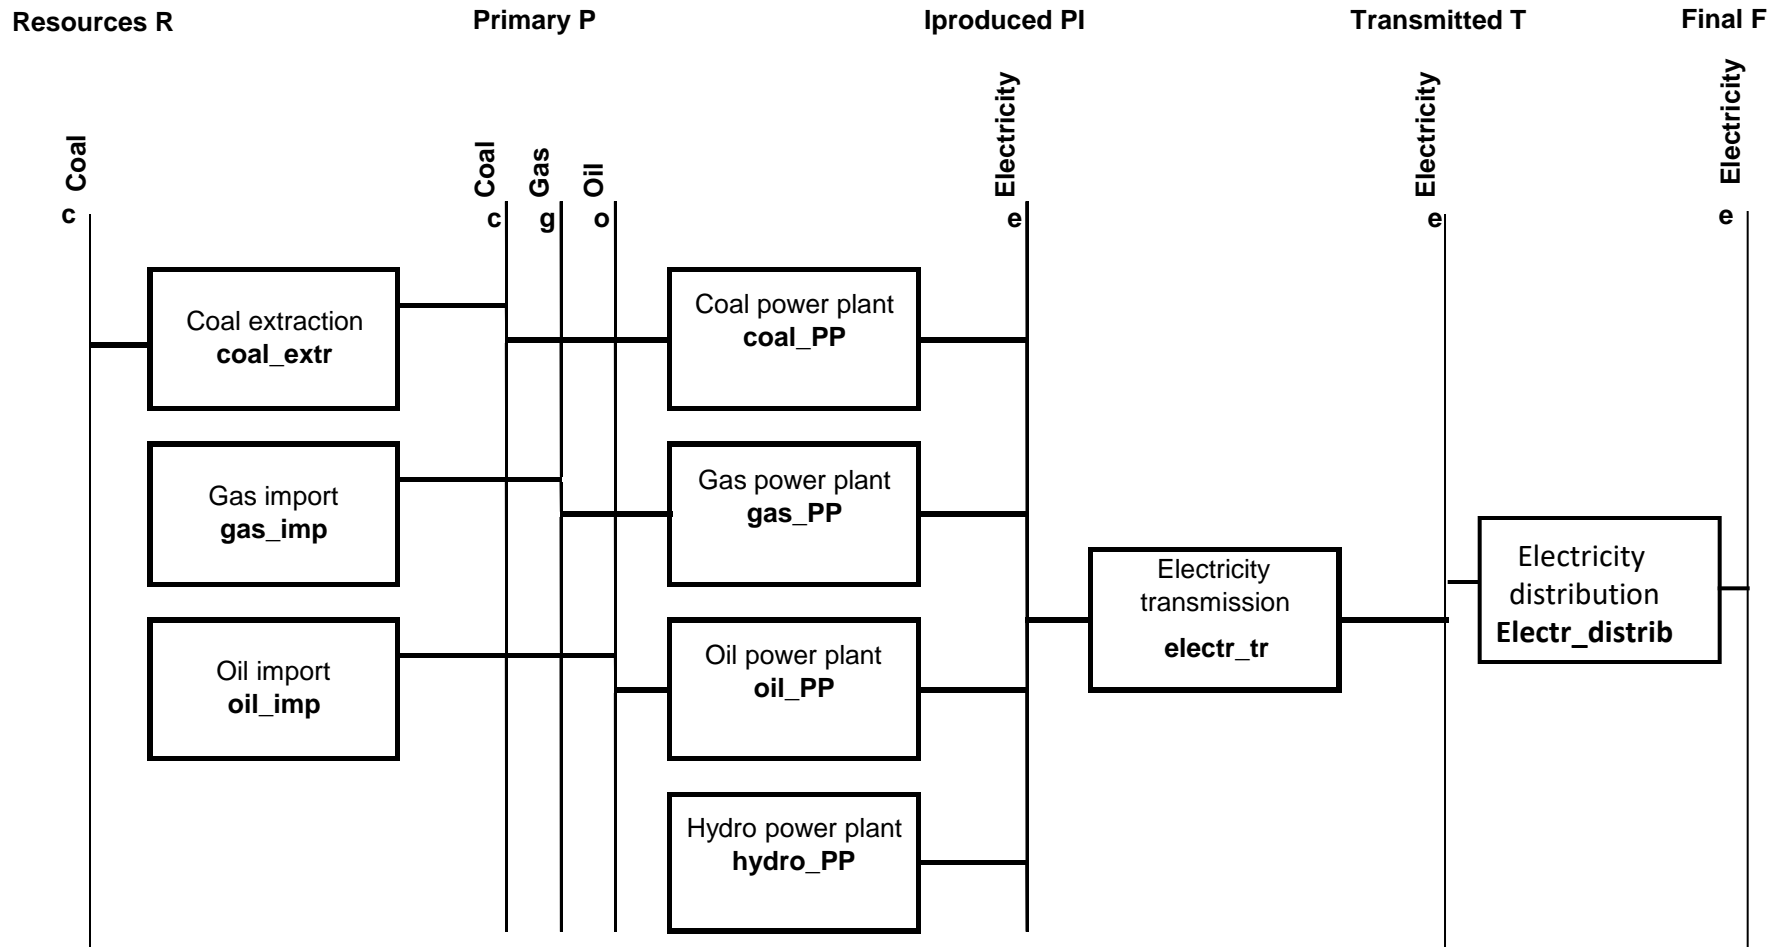

# Principal structure of electricity system

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Representation of electricity system in model

# Mathematical formulation of energy system development problem

- $\min \quad c' * x$

- **Subject to**

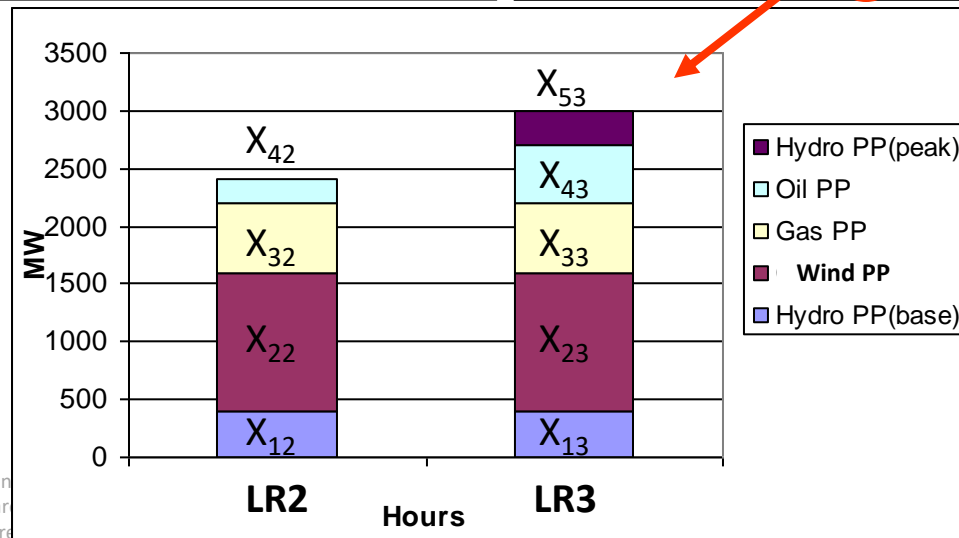

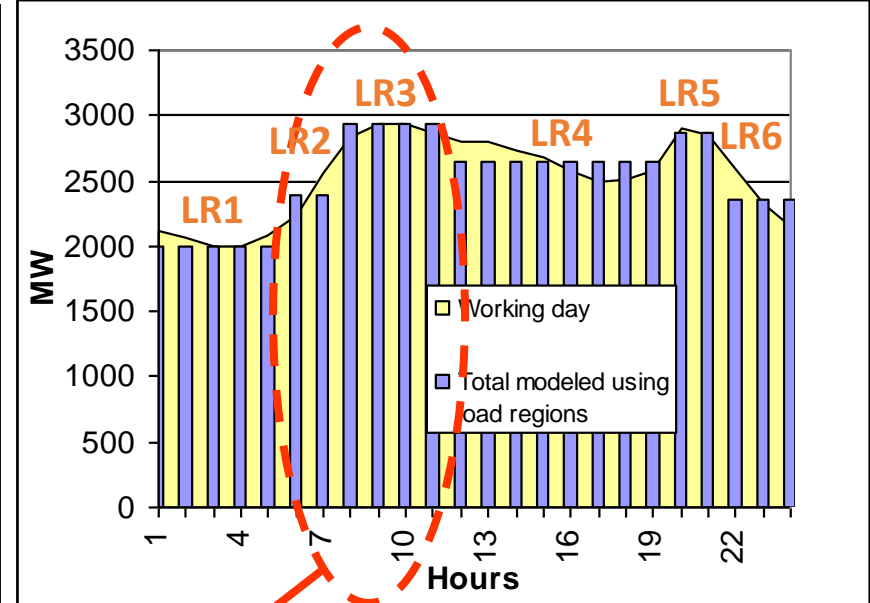

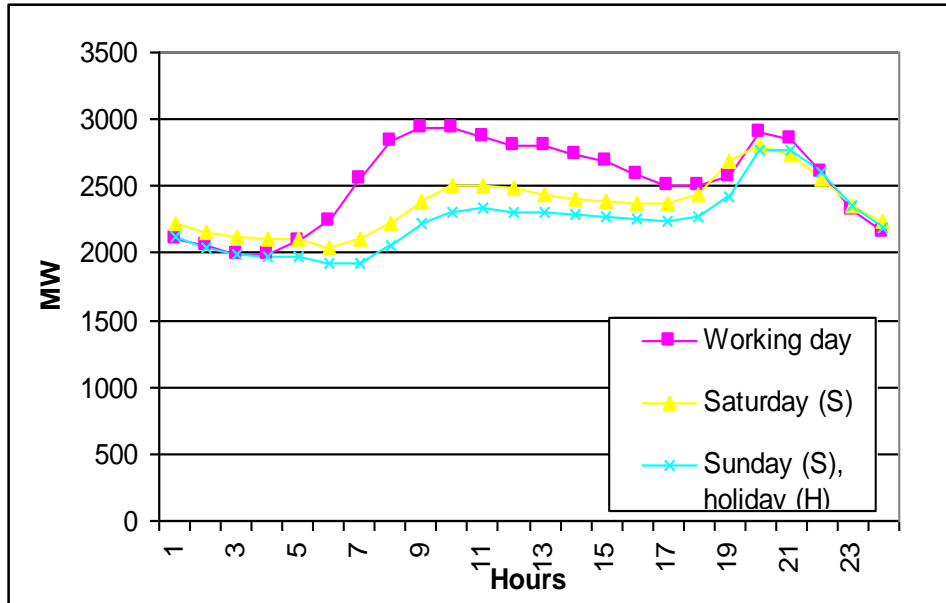

- $A * x \Rightarrow b$

- $u \leq x \leq l$

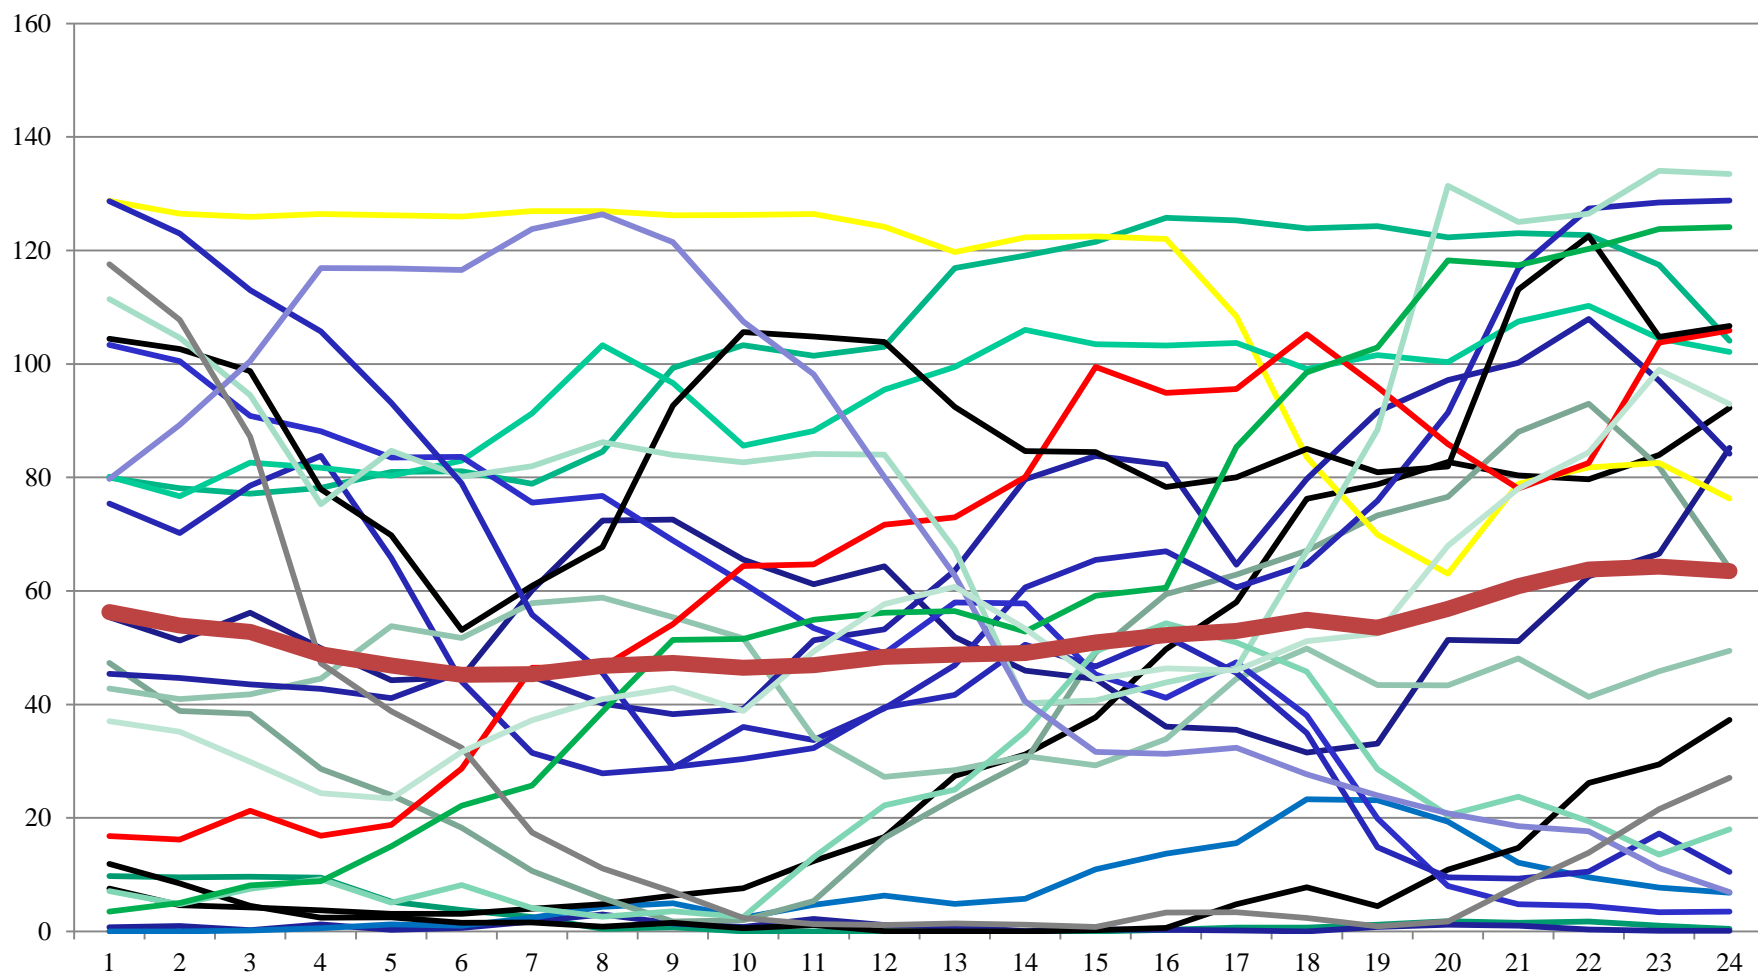

# Formulation of energy balance equations

$$\Sigma \text{ production} - \Sigma \text{ consumption} \geq 0$$

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 101019718.

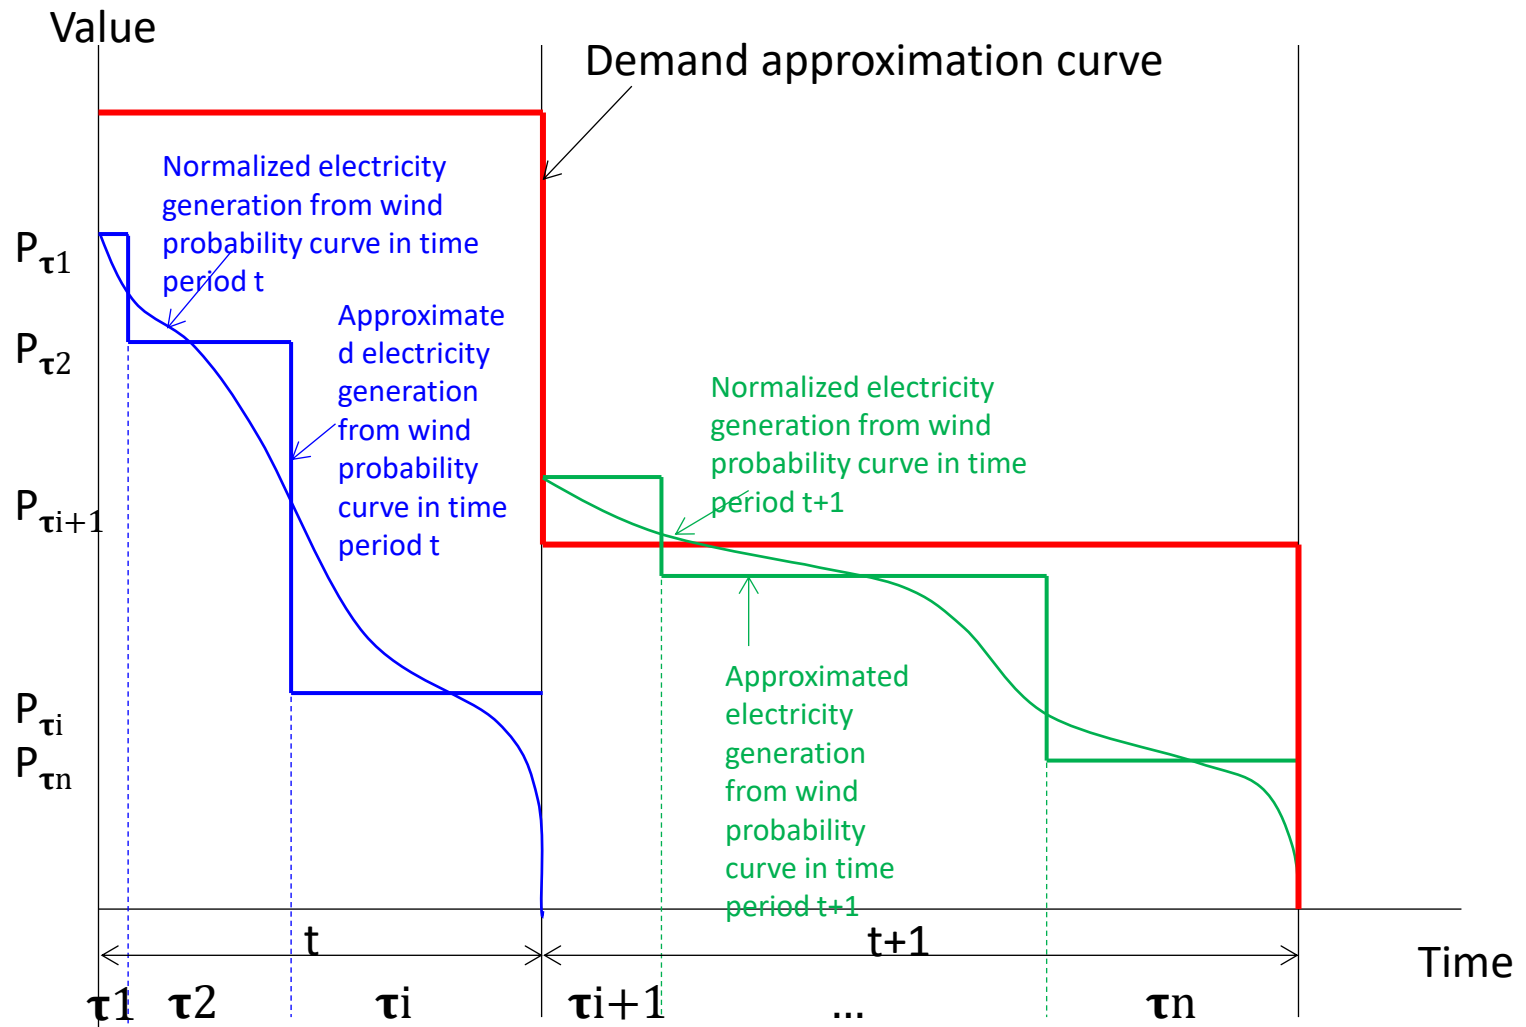

# Electricity generation by Wind PP

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Wind probability curves and their use

# Methodological approach

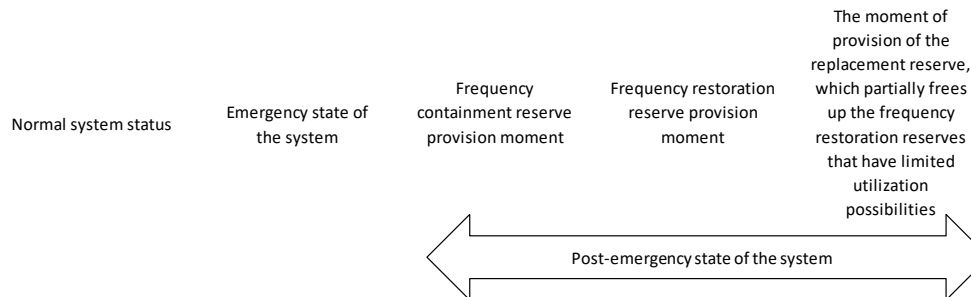

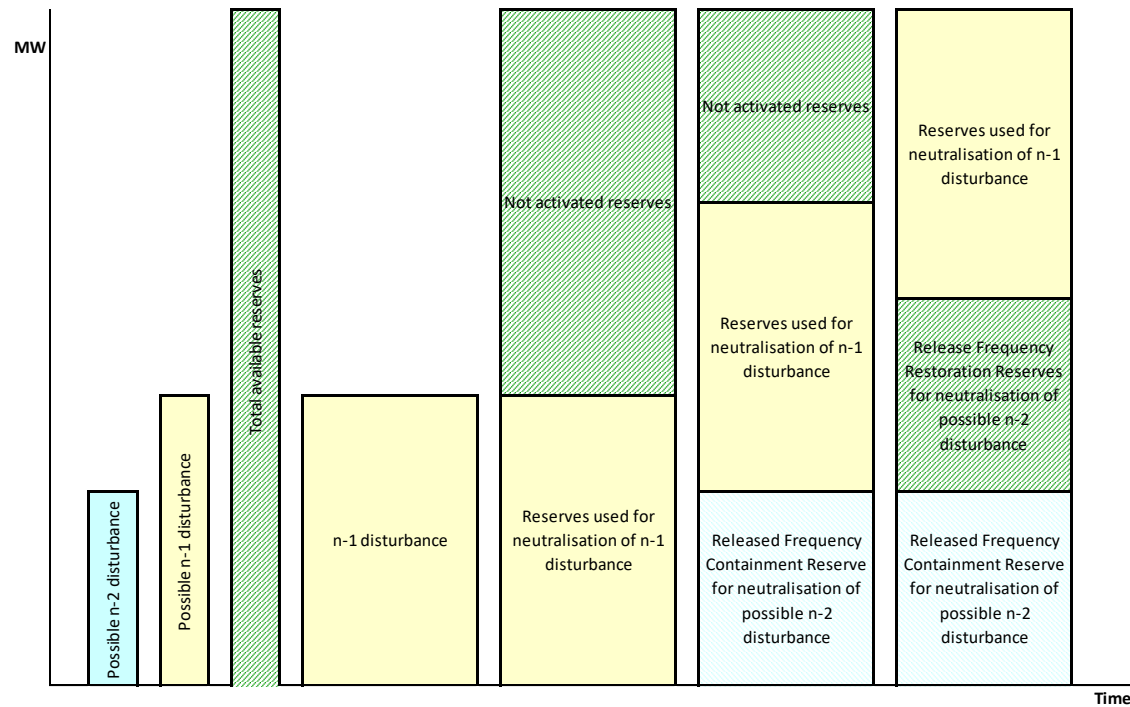

## *Modelling of reservation options*

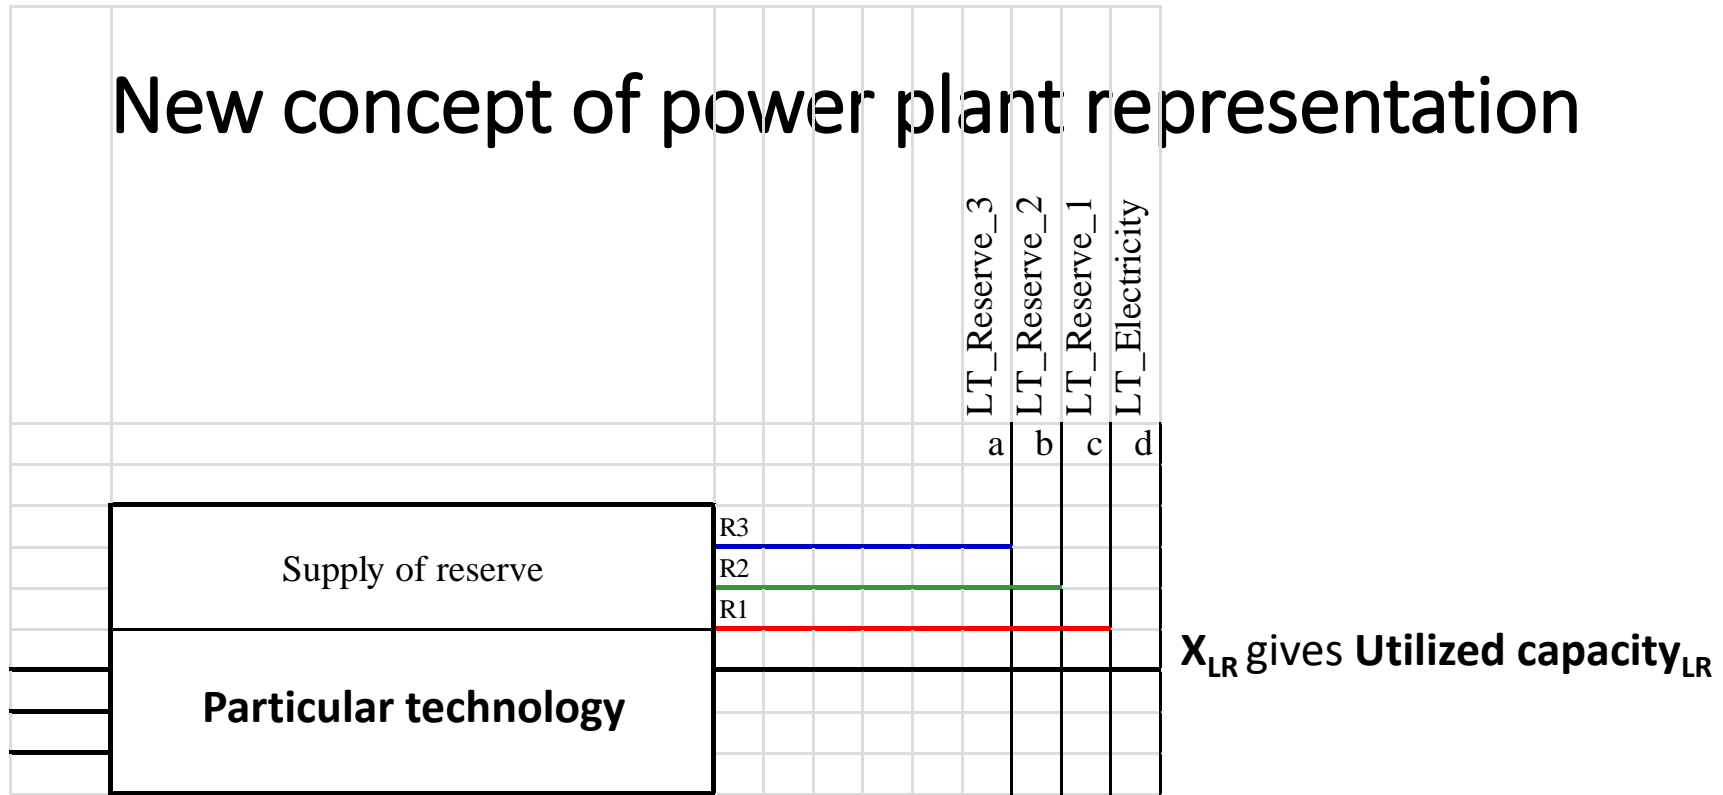

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Reserve requirements for reservation of large units in power systems

# New concept of power plant representation

Primary reserve: Is plant suitable to provide R1?

$$R1_{LR} \leq a * X_{LR} \text{ (If suitable),}$$

$$R1_{LR} \leq 0 \text{ (If not suitable)}$$

Secondary and tertiary reserve: Is plant suitable for supplying R2?

$$R2_{LR} \leq 0 \text{ (If not suitable)}$$

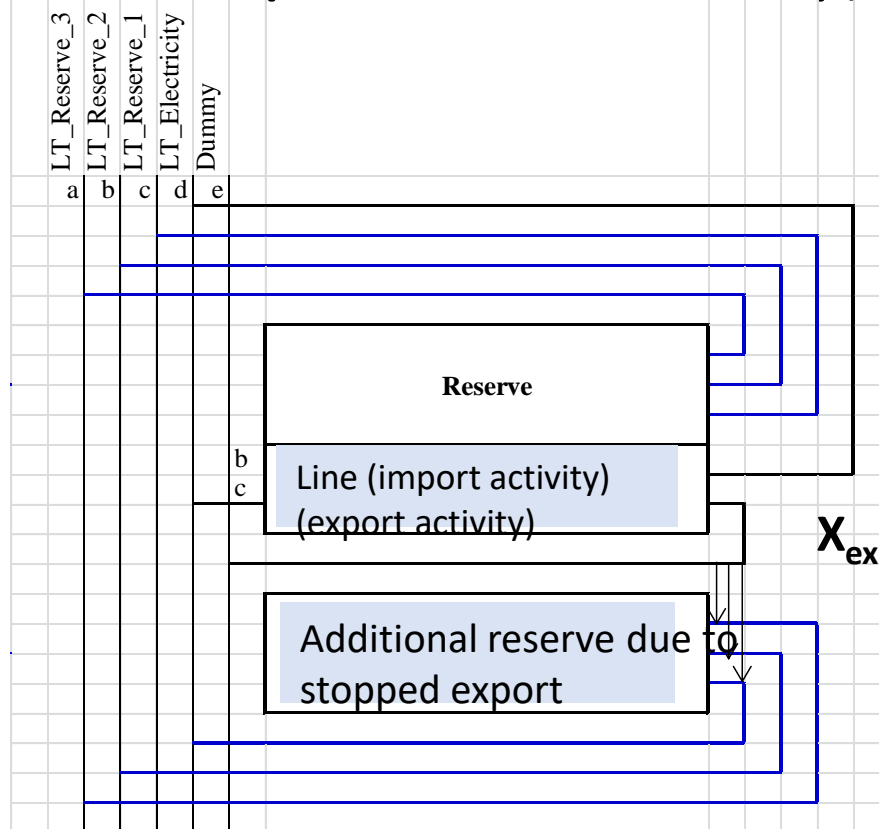

Plants based on renewable sources (Wind, Solar)?

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

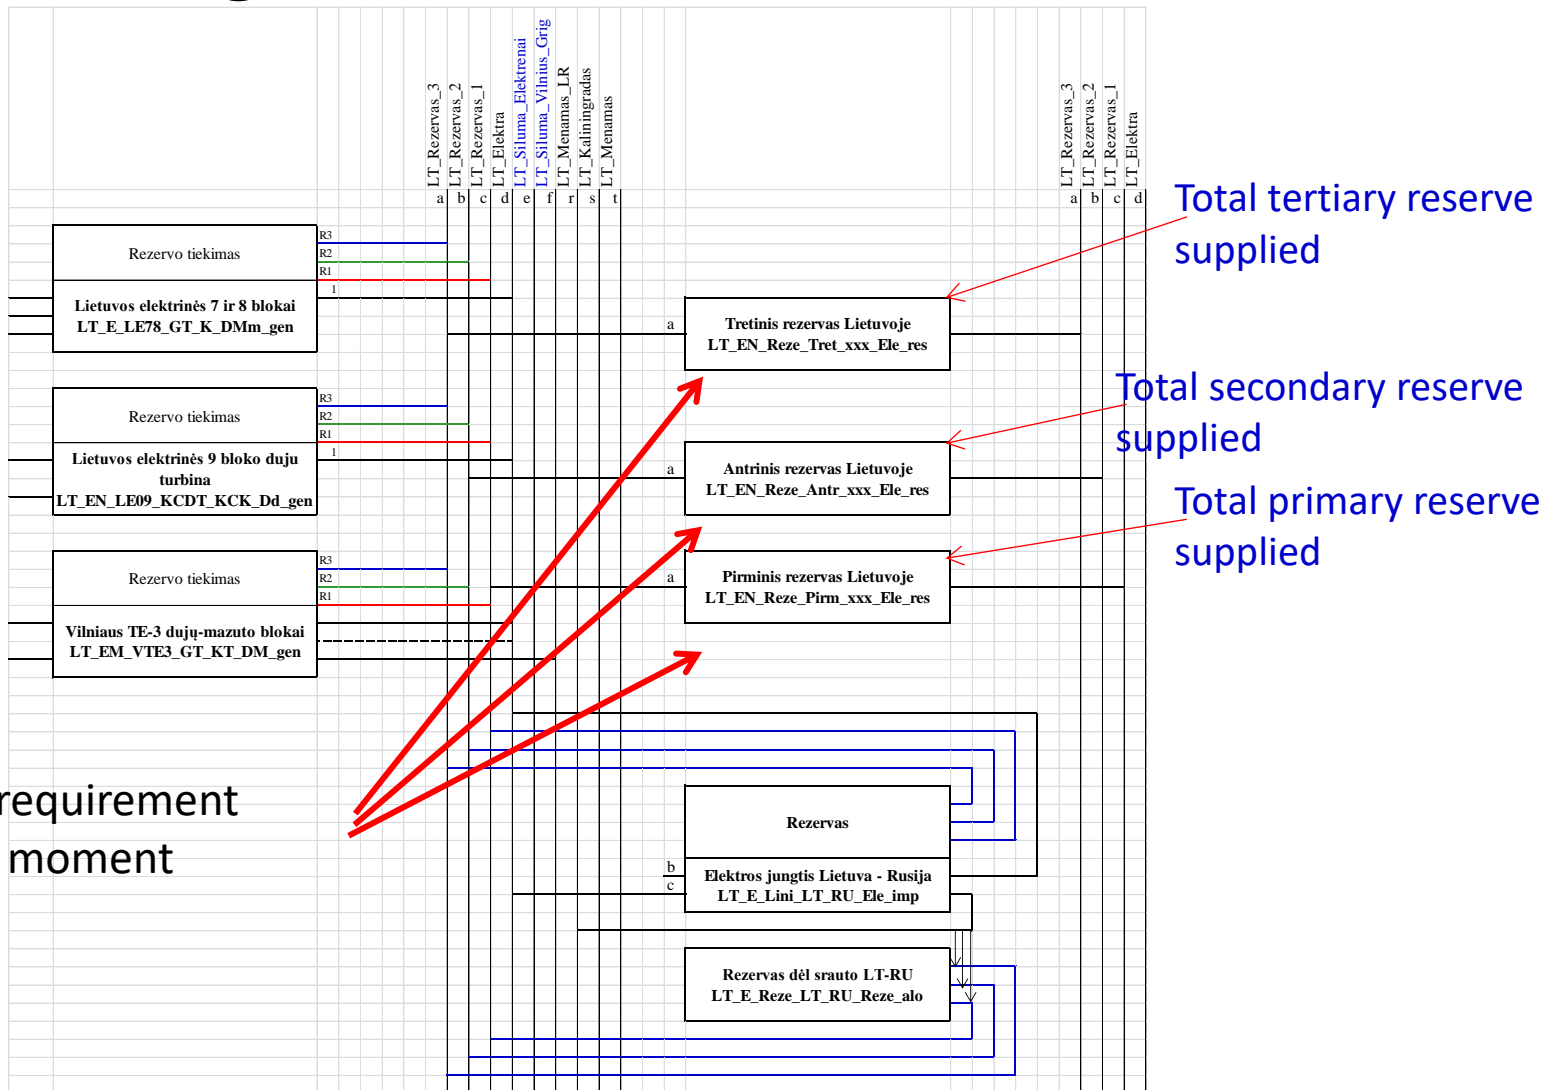

# Supply of reserves via line between countries (Import and export of electricity)

Reserve capacities ( $R1, R2, R3$ ) in each LR that can be taken from other countries due to stopped electricity export are  $\leq X_{\text{export LR}}$   
 $(R1_{\text{LR}} \leq X_{\text{export LR}}, R2_{\text{LR}} \leq X_{\text{export LR}}, R3_{\text{LR}} \leq X_{\text{export LR}})$

# Modelling of reserves

What is its requirement in the each moment (LR)?

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Reserve (R1,R2,R3) requirement in each moment (LR) of time

$$R1_{LR} \Rightarrow X_{\text{largest unit LR}} + R1_{\text{largest unit LR}}$$

$$R2_{LR} \Rightarrow X_{\text{largest unit LR}} + R2_{\text{largest unit LR}}$$

$$R3_{LR} \Rightarrow X_{\text{largest unit LR}} + R3_{\text{largest unit LR}}$$

$$R1_{LR} \Rightarrow X_{\text{second largest unit LR}} + R1_{\text{second largest unit LR}}$$

$$R2_{LR} \Rightarrow X_{\text{second largest unit LR}} + R1_{\text{second largest unit LR}}$$

$$R3_{LR} \Rightarrow X_{\text{second largest unit LR}} + R1_{\text{second largest unit LR}}$$

$$R1_{LR} \Rightarrow \text{reserve margin} * \text{peak demand}_{LR}$$

$$R2_{LR} \Rightarrow \text{reserve margin} * \text{peak demand}_{LR}$$

$$R3_{LR} \Rightarrow \text{reserve margin} * \text{peak demand}_{LR}$$

# Harmonisation of the Baltic energy security study with the research on energy sector development on EU level

*(With the results of TIMES PanEU model)*

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Main factors defining energy sector development pathways in the TIMES PanEU model

- Emissions of greenhouse gases (GHG)
- Use of renewable energy sources

*The emission reduction target for the **emission trading sector (ETS)** was set for the entire European Union. It was assumed that GHG emissions in the ETS should be reduced by **21% in 2020, by 43% in 2030 and by 83% in 2050**. All reduction rates are compared to the 2005 emission level.*

# Emission reduction targets for non ETS

	Targets for 2020	Targets for 2030	Target for 2050
<b>Finland</b>	-16%	-39%	-80%
<b>Estonia</b>	11%	-13%	-60%
<b>Latvia</b>	17%	-6%	-60%
<b>Lithuania</b>	15%	-9%	-60%

# RES targets for the country

	2020	2030	2040	2050
Finland	38%	50%	68%	85%
Estonia	25%	38%	56%	75%
Latvia	40%	49%	62%	75%
Lithuania	23%	36%	56%	75%

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Targets for entire region (*derived from Times PanEU results*)

*RES target shares in primary energy consumption for electricity and district heat production*

# Utilisation of interconnectors in Baltics

Base scenario, 2030

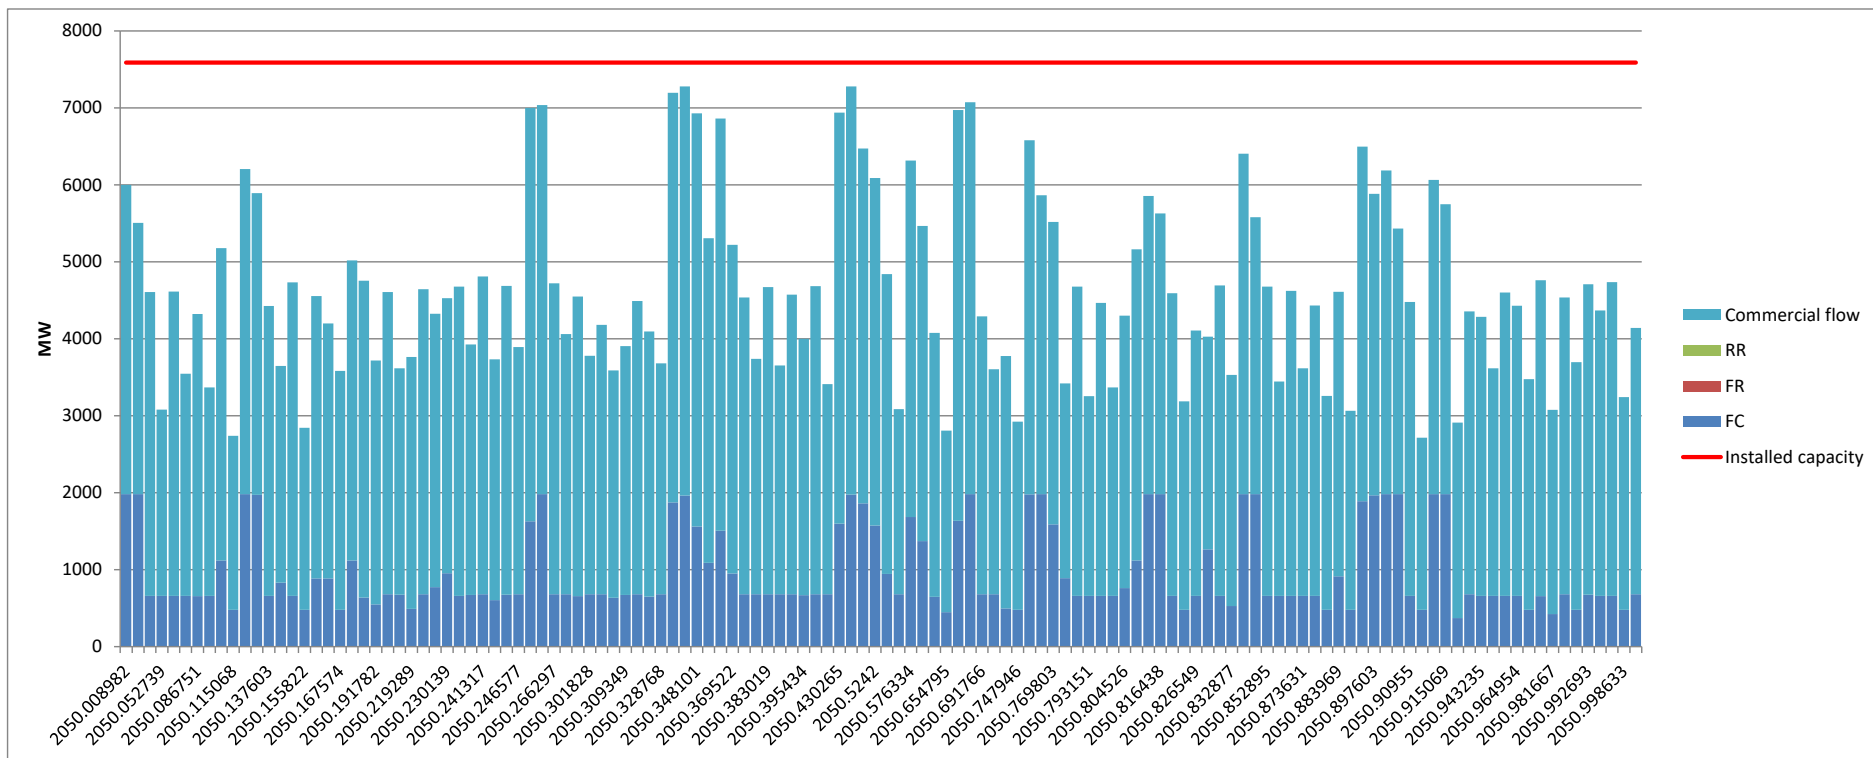

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Utilisation of interconnectors in Baltics

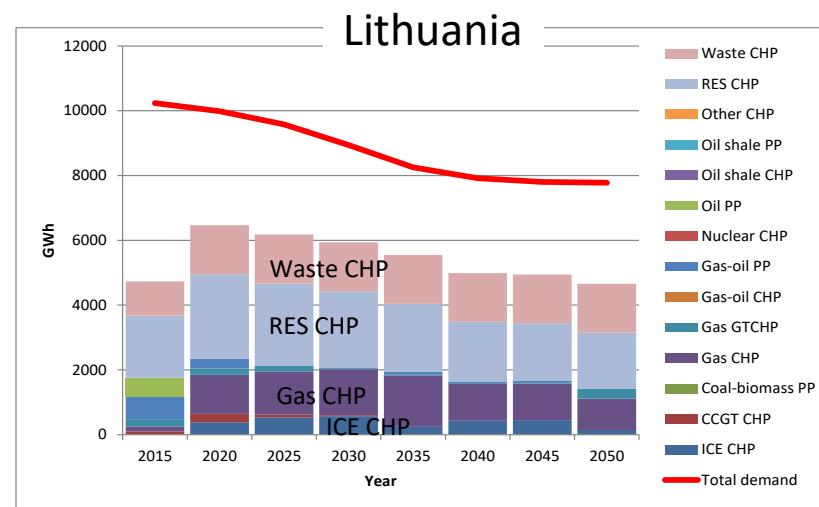

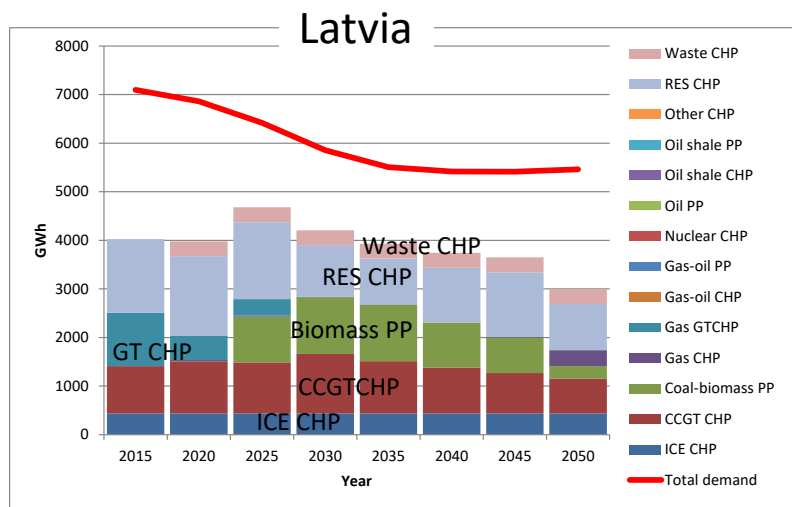

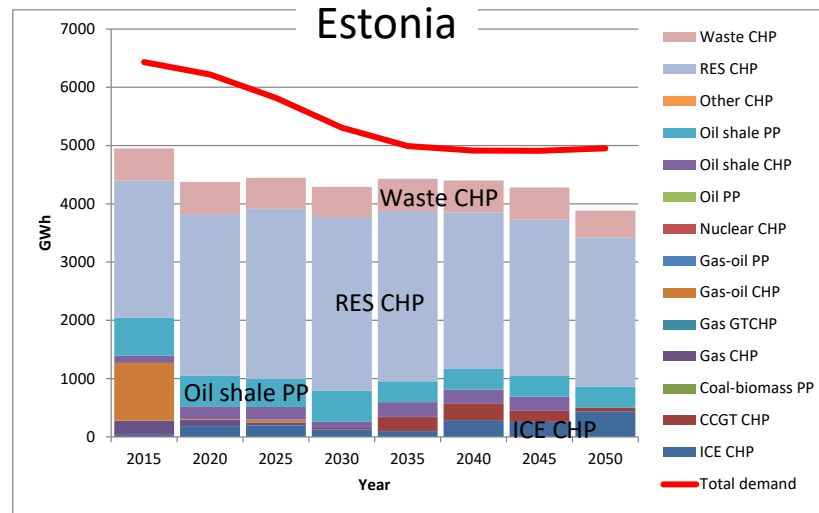

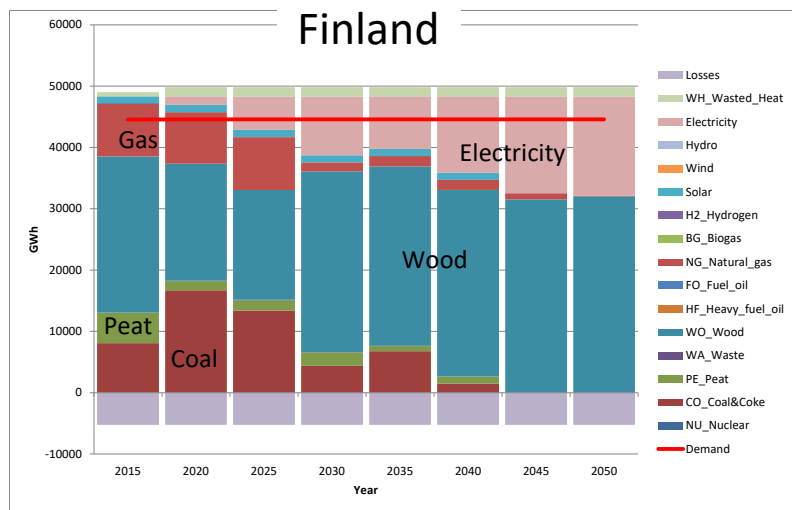

Base scenario, 2050

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Production of district heat (Base sc.)

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 691739.

# Conclusions

- *Refurbishment of existing hydro power plants, construction of wind power plants, CHPs running on biomass and municipal waste, CHPs running on natural gas and biogas* are the most attractive electricity generation options in the Baltic States and Finland. *Biomass boilers, CHP's and heat pumps* are economically more preferable for heat production. The development of other technologies in the near future is economically less justifiable, due to electricity import driven by the relatively low electricity market prices and environmental limitations
- *Significant share of intermittent electricity generation* (in particular from wind) *imposes energy security challenges* as it requires the power system to maintain sufficient *balancing capacities*
- Balancing power obtained via *interconnectors* from available sources in neighbouring countries, *gas turbine CHPs, gas turbine power plants* and plants with *internal combustion engines* are the most cost effective measures to reduce the generation intermittence problem

# Conclusions

- The Baltic States have powerful electrical connections with neighbouring power systems from which they import large amount of required electricity. The capacity of a separate power line may exceed 30-50% of each country's total power demand. *The possible malfunctions of such a line may cause significant energy security problems if required reserve capacities are not available*
- Study results show that in theory the *power system should not face any serious disruptions*. However, in practice, certain elements that ensure the provision of reservation services ***may not be implemented or their functioning may not correspond to the real threats*** that can appear due to failure of a powerful line, especially in the case where throughput capacity of interconnectors could be reduced due to various reasons. Looking at the current situation, the *biggest problems are related to the provision of frequency containment and replacement reserves*.

# Conclusions

The results of the case study suggest that the *number of interconnectors and their throughput capacities*, used for electricity trade between countries as well as for providing balancing and reservation services, *should be maintained or even extended*

*Existing fossil fuel power plants*, currently not competitive in the electricity market *can still be a cost-effective option to provide reserve services and ensure energy security.*

*Significant growth of biofuel use and it's dominance* , especially in heat production, is not a good phenomenon in terms of energy security. This may have an *impact on the competition between fuel types* and **lead to fuel price growth**. On the other hand, this **can cause unsustainable processes in forestry** if insufficient attention is paid to reforestation, cultivation and forest care

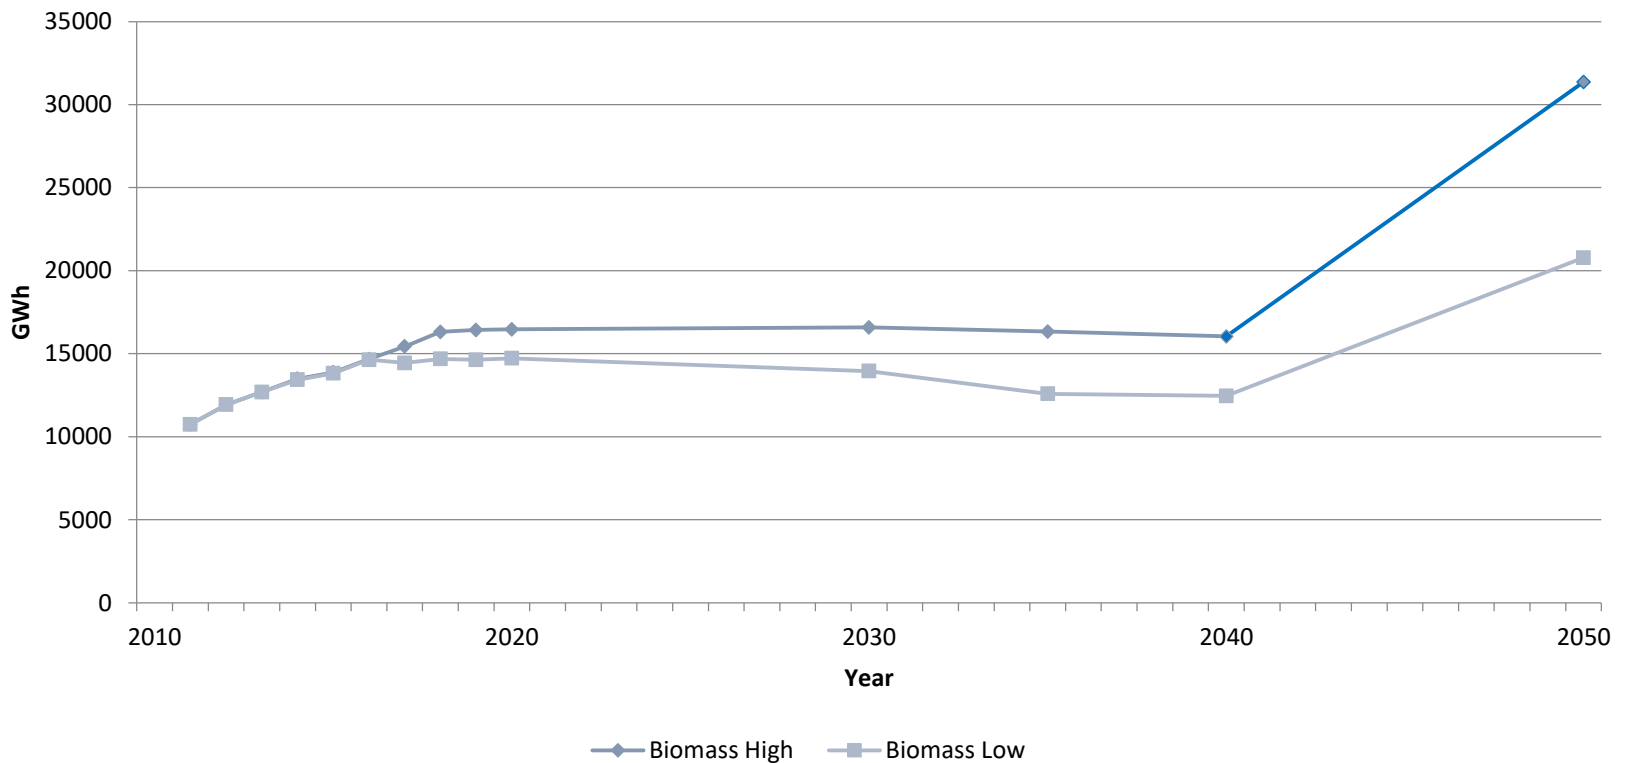

# Thank you for your attention
